

State of the World's Mothers 2011

Save the Children®

*Norway Tops List, Afghanistan Ranks Last,
United States Ranks 31st*

Save the Children's twelfth annual *Mothers' Index* compares the well-being of mothers and children in 164 countries – more than in any previous year. The *Mothers' Index* also provides information on an additional eight countries, four of which report sufficient data to present findings on children's indicators. When these are included, the total comes to 172 countries.

Norway, Australia and Iceland top the rankings this year. The top 10 countries, in general, attain very high scores for mothers' and children's health, educational and economic status. Afghanistan ranks last among the 164 countries surveyed. The 10 bottom-ranked countries – eight from sub-Saharan Africa – are a reverse image of the top 10, performing poorly on all indicators. The United States places 31st this year.

Conditions for mothers and their children in the bottom countries are grim. On average, 1 woman in 30 will die from pregnancy-related causes. One child in 6 dies before his or her fifth birthday, and 1 child in 3 suffers from malnutrition. Nearly 50 percent of the population lacks access to safe water and only 4 girls for every 5 boys are enrolled in primary school.

The gap in availability of maternal and child health services is especially dramatic when comparing Norway and Afghanistan. Skilled health personnel are present at virtually every birth in Norway, while only 14 percent of births are attended in Afghanistan. A typical Norwegian woman has 18 years of formal education and will live to be 83 years old; 82 percent are using some modern method of contraception, and only 1 in 175 will lose a child before his or her fifth birthday. At the opposite end of the spectrum, in Afghanistan, a typical woman has fewer than five years of education and will not live to be 45. Less than 16 percent of women are using modern contraception, and 1 child in 5 dies before reaching

age 5. At this rate, every mother in Afghanistan is likely to suffer the loss of a child.

Zeroing in on the children's well-being portion of the *Mothers' Index*, Sweden finishes first and Somalia is last out of 168 countries. While nearly every Swedish child – girl and boy alike – enjoys good health and education, children in Somalia face a more than 1 in 6 risk of dying before age 5. Thirty-six percent of Somali children are malnourished and 70 percent lack access to safe water. One in 3 primary-school-aged children in Somalia are enrolled in school, and within that meager enrollment, boys outnumber girls almost 2 to 1.

These statistics go far beyond mere numbers. The human despair and lost opportunities represented in these numbers demand mothers everywhere be given the basic tools they need to break the cycle of poverty and improve the quality of life for themselves, their children, and for generations to come.

See the Appendix for the *Complete Mothers' Index* and *Country Rankings*.

2011 MOTHERS' INDEX RANKINGS

TOP 10 BEST PLACES TO BE A MOTHER		BOTTOM 10 WORST PLACES TO BE A MOTHER	
RANK	COUNTRY	RANK	COUNTRY
1	Norway	155	Central African Republic
2	Australia	156	Sudan
3	Iceland	157	Mali
4	Sweden	158	Eritrea
5	Denmark	159	DR Congo
6	New Zealand	160	Chad
7	Finland	161	Yemen
8	Belgium	162	Guinea-Bissau
9	Netherlands	163	Niger
10	France	164	Afghanistan

APPENDIX: THE MOTHERS' INDEX AND COUNTRY RANKINGS

The twelfth annual *Mothers' Index* helps document conditions for mothers and children in 164 countries – 43 developed nations and 121 in the developing world – and shows where mothers fare best and where they face the greatest hardships. All countries for which sufficient data are available are included in the *Index*.

Why should Save the Children be so concerned with mothers? Because more than 75 years of field experience have taught us that the quality of children's lives depends on the health, security and well-being of their mothers. In short, providing mothers with access to education, economic opportunities and maternal and child health care gives mothers and their children the best chance to survive and thrive.

The *Index* relies on information published by governments, research institutions and international agencies. *The Complete Mothers' Index*, based on a composite of separate indices for women's and children's well-being, appears in the fold-out table in this appendix. A full description of the research methodology and individual indicators appears after the fold-out.

Mothers' Index Rankings

European countries – along with Australia and New Zealand – dominate the top positions while countries in sub-Saharan Africa dominate the lowest tier. The United States places 31st this year.

While most industrialized countries cluster tightly at the top of the *Index* – with the majority of these countries performing well on all indicators – the highest ranking countries attain very high scores for mothers' and children's health, educational and economic status.

The top 10 countries this year are (from 1 to 10): Norway, Australia and Iceland (tied), Sweden, Denmark, New Zealand, Finland, Belgium, Netherlands and France.

The bottom 10 countries are (from 155 to 164): Central African Republic, Sudan, Mali, Eritrea, Democratic Republic of the Congo, Chad, Yemen, Guinea-Bissau, Niger and Afghanistan.

The 10 bottom-ranked countries in this year's *Mothers' Index* are a reverse image of the top 10, performing poorly on all indicators. Conditions for mothers and their children in these countries are devastating.

- Over half of all births are not attended by skilled health personnel.
- On average, 1 woman in 30 dies from pregnancy-related causes.

- 1 child in 6 dies before his or her fifth birthday.
- 1 child in 3 suffers from malnutrition.
- 1 child in 7 is not enrolled in primary school.
- Only 4 girls are enrolled in primary school for every 5 boys.
- On average, females have fewer than 6 years of formal education.
- Women earn only 40 percent of what men do.
- 9 out of 10 women are likely to suffer the loss of a child in their lifetime.

The contrast between the top-ranked country, Norway, and the lowest-ranked country, Afghanistan, is striking. Skilled health personnel are present at virtually every birth in Norway, while only 14 percent of births are attended in Afghanistan. A typical Norwegian woman has 18 years of formal education and will live to be 83 years old, 82 percent are using some modern method of contraception, and only one in 175 will lose a child before his or her fifth birthday. At the opposite end of the spectrum, in Afghanistan, a typical woman has fewer than 5 years of education and doesn't live to be 45. Less than 16 percent of women are using modern contraception, and 1 child in 5 dies before reaching age 5. At this rate, every mother in Afghanistan is likely to suffer the loss of a child.

The data collected for the *Mothers' Index* document the tremendous gaps between rich and poor countries and the urgent need to accelerate progress in the health and well-being of mothers and their children. The data also highlight the regional dimension of this tragedy. Eight of the bottom 10 countries are in sub-Saharan Africa. Sub-Saharan Africa also accounts for 18 of the 20 lowest-ranking countries.

WHAT THE NUMBERS DON'T TELL YOU

The national-level data presented in the *Mothers' Index* provide an overview of many countries. However, it is important to remember that the condition of geographic or ethnic sub-groups in a country may vary greatly from the national average. Remote rural areas tend to have fewer services and more dire statistics. War, violence and lawlessness also do great harm to the well-being of mothers and children, and often affect certain segments of the population disproportionately. These details are hidden when only broad national-level data are available.

Individual country comparisons are especially startling when one considers the human suffering behind the statistics:

- Fewer than 15 percent of births are attended by skilled health personnel in Chad and Afghanistan. In Ethiopia, only 6 percent of births are attended. Compare that to 99 percent in Sri Lanka and 95 percent in Botswana.
- 1 woman in 11 dies in pregnancy or childbirth in Afghanistan. The risk is 1 in 14 in Chad and Somalia. In Italy and Ireland, the risk of maternal death is less than 1 in 15,000 and in Greece it's 1 in 31,800.
- A typical woman will die before the age of 50 in Central African Republic, Democratic Republic of the Congo, Mali, Mozambique, Nigeria, Sierra Leone, Zambia and Zimbabwe. Life expectancy for women is only 46 in Lesotho and Swaziland. In Afghanistan, the average woman does not live to see her 45th birthday while in Japan women on average live to almost 87 years old.
- In Somalia, only 1 percent of women use modern contraception. Rates are less than 5 percent in Angola, Chad and Guinea. And fewer than 1 in 10 women use modern contraception in 15 other developing countries. By contrast, 80 percent or more of women in China, Norway, Thailand and the United Kingdom use some form of modern contraception.
- In Afghanistan, Jordan, Lebanon, Libya, Morocco, Oman, Pakistan, Syria and Yemen women earn 25 cents or less for every dollar men earn. Saudi and Palestinian women earn only 16 and 12 cents respectively to the male dollar. In Mongolia, women earn 87 cents for every dollar men earn and in Mozambique they earn 90.
- In Qatar, Saudi Arabia and the Solomon Islands, not one seat in parliament is occupied by a woman. In Comoros and Papua New Guinea women have only 1 seat. Compare that to Rwanda, where over half of all seats are held by women.
- A typical female in Afghanistan, Angola, Djibouti, Eritrea and Guinea-Bissau receives fewer than 5 years of formal education. In Niger, it's fewer than 4 years and in Somalia, women receive less than 2 years of education. In Australia and New Zealand, the average woman stays in school for over 20 years.
- In Somalia, 2 out of 3 children are *not* enrolled in primary school. More than half (52 percent) of all children in Eritrea are not in school. In Djibouti and Papua New Guinea out-of-school rates are 45 percent. In comparison, nearly all children France, Italy, Spain and Sweden make it from preschool all the way to high school.
- In Central African Republic and Chad, 7 girls for every 10 boys are enrolled in primary school. In Afghanistan and Guinea-Bissau, it's 2 girls for every 3 boys. And in Somalia, boys outnumber girls by almost 2 to 1.
- 1 child in 5 does not reach his or her fifth birthday in Afghanistan, Chad and Democratic Republic of the Congo. In Finland, Greece, Iceland, Japan, Luxembourg, Norway, Singapore, Slovenia and Sweden, only 1 child in 333 dies before age 5.
- Over 40 percent of children under age 5 suffer from malnutrition in Bangladesh, Madagascar, Nepal, Niger and Yemen. In India and Timor-Leste, nearly half of all young children are moderately or severely underweight.
- More than half of the population of Afghanistan, DR Congo, Equatorial Guinea, Ethiopia, Fiji, Madagascar, Mauritania, Mozambique, Niger, Papua New Guinea and Sierra Leone lacks access to safe drinking water. In Somalia, 70 percent of people lack access to safe water.

Statistics are far more than numbers. It is the human despair and lost opportunities behind these numbers that call for changes to ensure that mothers everywhere have the basic tools they need to break the cycle of poverty and improve the quality of life for themselves, their children, and for generations to come.

Why doesn't the United States do better in the rankings?

The United States ranked 31st this year based on several factors:

- One of the key indicators used to calculate well-being for mothers is lifetime risk of maternal mortality. The United States' rate for maternal mortality is 1 in 2,100 – the highest of any industrialized nation. In fact, only three Tier I developed countries – Albania, the Russian Federation and Moldova – performed worse than the United States on this indicator. A woman in the U.S. is more than 7 times as likely as a woman in Italy or Ireland to die from pregnancy-related causes and her risk of maternal death is 15-fold that of a woman in Greece.
- Similarly, the United States does not do as well as most other developed countries with regard to under-5 mortality. The U.S. under-5 mortality rate is 8 per 1,000 births. This is on par with rates in Latvia. Forty countries performed better than the U.S. on this indicator. At this rate, a child in the U.S. is more than twice as likely as a child in Finland, Greece, Iceland, Japan, Luxembourg, Norway, Slovenia, Singapore or Sweden to die before reaching age 5.
- Only 58 percent of children in the United States are enrolled in preschool – making it the fifth lowest country in the developed world on this indicator.
- The United States has the least generous maternity leave policy – both in terms of duration and percent of wages paid – of any wealthy nation.
- The United States is also lagging behind with regard to the political status of women. Only 17 percent of congressional seats are held by women, compared to 45 percent in Sweden and 43 percent in Iceland.

Why is Norway number one?

Norway generally performed as well as or better than other countries in the rankings on all indicators. It has the highest ratio of female-to-male earned income, the highest contraceptive prevalence rate, one of the lowest under-5 mortality rates and one of the most generous maternity leave policies in the developed world.

Why is Afghanistan last?

Afghanistan has the highest lifetime risk of maternal mortality and the lowest female life expectancy in the world. It also places second to last on skilled attendance at birth, under-5 mortality and gender disparity in primary education. Performance on most other indicators also places Afghanistan among the lowest-ranking countries in the world.

Why are some countries not included in the Mothers' Index?

Rankings were based on a country's performance with respect to a defined set of indicators related primarily to health, nutrition, education, economic and political status. There were 164 countries for which published information regarding performance on these indicators existed. All 164 were included in the study. The only basis for excluding countries was insufficient or unavailable data or national populations below 250,000.

What should be done to bridge the divide between countries that meet the needs of their mothers and those that don't?

- Governments and international agencies need to increase funding to improve education levels for women and girls, provide access to maternal and child health care and advance women's economic opportunities.
- The international community also needs to improve current research and conduct new studies that focus specifically on mothers' and children's well-being.
- In the United States and other industrialized nations, governments and communities need to work together to improve education and health care for disadvantaged mothers and children.

Note: Data refer to the year specified in the column heading or the most recently available.

— No data ' calendar days " working days (all other days unspecified)

+ The *Mothers' Index* rankings include only those countries for which sufficient data were available to calculate both the Women's and Children's Indexes. The *Women's Index* and *Children's Index* ranks, however, include additional countries for which adequate data were available to present findings on either women's or children's indicators, but not both. For complete methodology see *Methodology and Research Notes*.

(i) The total refers to all voting members of the House; (ii) Figures calculated on the basis of permanent seats only; (iii) The parliament was dissolved following the December 2008 coup; (iv) There is no parliament; (v) Parliament has been dissolved or suspended for an indefinite period; (vi) The legislative council has been unable to meet and govern since 2007; (vii) Figures are from the previous term; recent election results were not available at the time of publication.

(a) 80% prior to birth and for 150 days after and 50% for the rest of the leave period; (b) A lump sum grant is provided for each child; (c) 82% for the first 30 days and 75% for the remaining period; (d) Up to a ceiling; (e) Benefits vary by county or province; (f) 45 days before delivery and 1 year after; (g) 100% until the child reaches 6 months, then at a flat rate for the remaining period; (h) Benefits vary, but there is a minimum flat rate; (i) 50% plus a dependent's supplement (10% each, up to 40%); (k) Paid amount not specified; (l) Paid only the first 13 weeks; (m) Parental benefits paid at 100% for 46-week option; 80% for 56-week option; (n) 100% of earnings paid for the first 6 months; 60% from the 6th-9th month; 30% for the last 3 months; (o) 480 calendar days paid parental leave; 80% for 390 days, flat rate for remaining 90; (p) 90% for the first 6 weeks and a flat rate for the remaining weeks; (q) There is no national program. Cash benefits may be provided at the state level; (r) Data excludes Northern Ireland; (s) Data pertain to nationals of the country; (t) Data pertain to the Jewish population; (w) Data pertain to Peninsular Malaysia; (y) Data are from an earlier publication of the same source; (z) Data differ from the standard definition and/or are from a secondary source

*These countries also offer prolonged periods of parental leave (at least two years). For additional information on child-related leave entitlements see OECD Family Database www.oecd.org/els/social/family/database

Complete Mothers' Index

1. In the first year of the *Mothers' Index* (2000), a review of literature and consultation with members of the Save the Children staff identified health status, educational status, political status and children's well-being as key factors related to the well-being of mothers. In 2007, the *Mothers' Index* was revised to include indicators of economic status. All countries with populations over 250,000 were placed into one of three tiers according to United Nations regional development groups: more developed countries, less developed countries and least developed countries. Indicators for each development group were selected to best represent factors of maternal well-being specific to that group and published data sources for each indicator were then identified. To facilitate international comparisons, in addition to reliability and validity, indicators were selected based on inclusivity (availability across countries) and variability (ability to differentiate between countries). To adjust for variations in data availability, when calculating the final index, indicators for maternal health and children's well-being were grouped into sub-indices (see step 7). This procedure allowed researchers to draw on the wealth of useful information on those topics without giving too little weight to the factors for which less abundant data were available. Data presented in this report includes information available through 01 March 2011.

2. In Tier I, data were gathered for seven indicators of women's status and three indicators of children's status. Sufficient data existed to include analyses of two additional indicators of children's well-being in Tiers II and III. Indicators unique to specific development groups are noted below.

THE INDICATORS THAT REPRESENT
WOMEN'S HEALTH STATUS ARE:

Lifetime risk of maternal death

A woman's risk of death in childbirth over the course of her life is a function of many factors, including the number of children she has and the spacing of births as well as the conditions under which she gives birth and her own health and nutritional status. The lifetime risk of maternal mortality is the probability that a 15-year-old

female will die eventually from a maternal cause. This indicator reflects not only the risk of maternal death per pregnancy or per birth, but also the level of fertility in the population. Competing causes of maternal death are also taken into account. Estimates are periodically calculated by an inter-agency group including WHO, UNICEF, UNFPA and the World Bank. Data are for 2008 and represent the most recent of these estimates available at the time of this analysis.

Source: WHO. *Trends in Maternal Mortality: 1990 to 2008*. (Geneva: 2010). whqlibdoc.who.int/publications/2010/9789241500265_eng.pdf

Percent of women using modern contraception

Access to family planning resources, including modern contraception, allows women to plan their pregnancies. This helps ensure that a mother is physically and psychologically prepared to give birth and care for her child. Data are derived from sample survey reports and estimate the proportion of married women (including women in consensual unions) currently using modern methods of contraception, which include: male and female sterilization, IUD, the pill, injectables, hormonal implants, condoms and female barrier methods. Contraceptive prevalence data are the most recently available as of May 2009.

Source: United Nations Population Division. *World Contraceptive Use 2009 (Wall Chart)*. www.un.org/esa/population/publications/contraceptive2009/contraceptive2009.htm

Skilled attendant at delivery

The presence of a skilled attendant at birth reduces the likelihood of both maternal and infant mortality. The attendant can help create a hygienic environment and recognize complications that require urgent medical care. Skilled attendance at delivery is defined as those births attended by physicians, nurses or midwives. Data are from 2005-2009. As nearly every birth is attended in the more developed countries, this indicator is not included in Tier I.

Female life expectancy

Children benefit when mothers live longer, healthier lives. Life expectancy reflects the health, social and economic status of a mother and captures trends in falling life expectancy associated with the feminization of HIV/

AIDS. Female life expectancy is defined as the average number of years of life that a female can expect to live if she experiences the current mortality rate of the population at each age. Data estimates are for 2010.

THE INDICATOR THAT REPRESENTS
WOMEN'S EDUCATIONAL STATUS IS:

Expected number of years of formal female schooling

Education is singularly effective in enhancing maternal health, women's freedom of movement and decision-making power within households. Educated women are more likely to be able to earn a livelihood and support their families. They are also more likely than uneducated women to ensure that their children eat well, finish school and receive adequate health care. Female school life expectancy is defined as the number of years a female child of school entrance age is expected to spend at school or university, including years spent on repetition. It is the sum of the age-specific enrollment ratios for primary, secondary, post-secondary non-tertiary and tertiary education. Primary to secondary estimates are used where primary to tertiary are not available. Data are from 2009 or the most recent year available.

THE INDICATORS THAT REPRESENT
WOMEN'S ECONOMIC STATUS ARE:

Ratio of estimated female to male earned income

Mothers are likely to use their influence and the resources they control to promote the needs of their children. Where mothers are able to earn a decent standard of living and wield power over economic resources, children survive and thrive. The ratio of estimated female earned income to estimated male earned income – how much women earn relative to men for equal work – reveals gender inequality in the workplace. Female and male earned income are crudely estimated based on the ratio of the female nonagricultural wage to the male nonagricultural wage, the female and male shares of the economically active population, the total female and male population, and GDP per capita in purchasing power parity terms in U.S. dollars. Estimates are based on data for the most recent year available between 1996 and 2007.

Source: United Nations Development Programme (UNDP). *Human Development Report 2009*. (New York: 2009) Table K, pp.186-189. <http://hdrstats.undp.org/en/indicators/130.html>

Maternity leave benefits

The maternity leave indicator includes both the length of time for which benefits are provided and the extent of compensation. The data are compiled by the International Labour Office and the United States Social Security Administration from a variety of legislative and non-legislative sources from 2004 to 2009. Data on maternity leave benefits are reported only for Tier I countries, where women comprise a considerable share of the non-agricultural workforce and thus most working mothers are free to enjoy the benefits of maternity leave.

Source: United Nations Statistics Division. *Statistics and indicators on women and men*. Table 5g. Updated December 2010. unstats.un.org/unsd/demographic/products/indwm/tab5g.htm

THE INDICATOR THAT REPRESENTS
WOMEN'S POLITICAL STATUS IS:

Participation of women in national government

When women have a voice in public institutions, they can participate directly in governance processes and advocate for issues of particular importance to women and children. This indicator represents the percentage of seats in single or, in the case of bicameral legislatures, upper and lower houses of national parliaments occupied by women. Data are as of 31 January 2011.

Source: Inter-Parliamentary Union (IPU). *Women in National Parliaments*. www.ipu.org/wmn-e/classif.htm

THE INDICATORS THAT REPRESENT
CHILDREN'S WELL-BEING ARE:

Under-5 mortality rate

Under-5 mortality rates are likely to increase dramatically when mothers receive little or no prenatal care and give birth under difficult circumstances, when infants are not exclusively breastfed, when few children are immunized and when fewer receive preventive or curative treatment for common childhood diseases. Under-5 mortality rate is the probability of dying between birth and exactly five years of age, expressed per 1,000 live births. Estimates are for 2009.

Source: UNICEF. *The State of the World's Children 2011*. (New York: 2010) Table 1, pp.88-91. www.unicef.org/sowc2011/statistics.php

Percentage of children under age 5 moderately or severely underweight

Poor nutrition affects children in many ways, including making them more susceptible to a variety of illnesses and impairing their physical and cognitive development. Children moderately or severely underweight are more than two and three standard deviations below median weight for age of the NCHS/WHO reference population respectively. Data are for the most recent year available between 2003 and 2009. Where NCHS/WHO data are not available, estimates based on

WHO Child Growth Standards are used. This indicator is included in Tier II and Tier III only, as few more developed countries report this data.

Source: UNICEF. *The State of the World's Children 2011*. (New York: 2010) Table 2, pp.92-95. www.unicef.org/sowc2011/statistics.php

Gross pre-primary enrollment ratio

Early childhood care and education, including pre-primary schooling, supports children's growth, development, learning and survival. It also contributes to proper health, poverty reduction and can provide essential support for working parents, particularly mothers. The pre-primary gross enrollment ratio is the total number of children enrolled in pre-primary education, regardless of age, expressed as a percentage of the total number of children of official pre-primary school age. The ratio can be higher than 100 percent when children enter school later than the official enrollment age or do not advance through the grades at expected rates. Data are for the school year ending in 2009 or the most recently available. Pre-primary enrollment is analyzed across Tier I countries only.

Source: UNESCO Institute for Statistics (UIS). Data Centre. stats.uis.unesco.org

Gross primary enrollment ratio

The gross primary enrollment ratio (GER) is the total number of children enrolled in primary school, regardless of age, expressed as a percentage of the total number of children of official primary school age. Where GERs are not available, net attendance ratios are used. Data are for the school year ending in 2009 or the most recently available. This indicator is not tracked in Tier I, where nearly all children complete primary school.

Sources: UNESCO Institute for Statistics (UIS). Data Centre. stats.uis.unesco.org, supplemented with data from UNESCO. *Global Education Digest 2009*. (Montreal: 2009) Table 3, pp.84-93. www.uis.unesco.org/template/pdf/ged/2009/GED_2009_EN.pdf and UNICEF. Primary School Participation. www.childinfo.org/education_primary.php

Gender parity index

Educating girls is one of the most effective means of improving the well-being of women and children. The ratio of gross enrollment of girls to boys in primary school – or Gender Parity Index (GPI) – measures gender disparities in primary school participation. It is calculated as the number of girls enrolled in primary school for every 100 enrolled boys, regardless of age. A score of 1 means equal numbers of girls and boys are enrolled; a score between 0 and 1 indicates a disparity in favor of boys; a score greater than 1 indicates a disparity in favor of girls. Where GERs are not available, net attendance ratios are used to calculate the GPI. Data are for the school year ending in 2009 or the most recently available. GPI is included in Tier III, where gender

equity gaps disadvantaging girls in access to education are the largest in the world.

Source: UNESCO Institute for Statistics (UIS). Data Centre. stats.uis.unesco.org

Gross secondary enrollment ratio

The gross secondary enrollment ratio is the total number of children enrolled in secondary school, regardless of age, expressed as a percentage of the total number of children of official secondary school age. Data are for the school year ending in 2009 or the most recently available. This indicator is not tracked in Tier III where many children still do not attend primary school, let alone transition to higher levels.

Sources: UNESCO Institute for Statistics (UIS). Data Centre. stats.uis.unesco.org, supplemented with data from UNESCO. *Global Education Digest 2009*. (Montreal: 2009) Table 5, pp.104-113. www.uis.unesco.org/template/pdf/ged/2009/GED_2009_EN.pdf and UNICEF. Secondary School Participation. www.childinfo.org/education_secondary.php

Percent of population with access to safe water

Safe water is essential to good health. Families need an adequate supply for drinking as well as cooking and washing. Access to safe and affordable water also brings gains for gender equity, especially in rural areas where women and young girls spend considerable time collecting water. This indicator reports the percentage of the population with access to an adequate amount of water from an improved source within a convenient distance from a user's dwelling, as defined by country-level standards. "Improved" water sources include household connections, public standpipes, boreholes, protected dug wells, protected springs and rainwater collection. In general, "reasonable access" is defined as at least 20 liters (5.3 gallons) per person per day, from a source within one kilometer (0.62 miles) of the user's dwelling. Data are for 2008.

Source: UNICEF. *The State of the World's Children 2011*. (New York: 2010) Table 3, pp.96-99. www.unicef.org/sowc2011/statistics.php

3. Missing data were supplemented when possible with data from the same source published in a previous year, as noted in the fold-out table in this appendix.
4. Data points were rounded to the tenths place for analysis purposes. Data analysis was conducted using Microsoft Excel software.
5. Standard scores, or z-scores, were created for each of the indicators using the following formula: $z = (x - \bar{x}) / s$ where:
z = The standard, or z-score
x = The score to be converted
 \bar{x} = The mean of the distribution
s = The standard deviation of the distribution

Nigeria ▲

6. The standard scores of indicators of ill-being were then multiplied by (-1) so that a higher score indicated increased well-being on all indicators.

Notes on specific indicators

- To facilitate cross-country comparisons, length of maternity leave was converted into days and allowances were averaged over the entire pay period.
- To report findings for the greatest number of countries possible, countries without a parliament, or where it has been dissolved, suspended or otherwise unable to meet, are given a “0” for political representation when calculating index scores.
- To avoid rewarding school systems where pupils do not start on time or fail to progress through the system at expected rates, gross enrollment ratios between 100 and 105 percent were discounted to 100 percent. Gross enrollment ratios over 105 percent were either discounted to 100 with any amount over 105 percent subtracted from 100 (for example, a country with a gross enrollment rate of 107 percent would be discounted to $100 - (107 - 105)$, or 98) or to the respective country’s net enrollment ratio, whichever was higher.
- To avoid rewarding countries in which girls’ educational progress is made at the expense of boys’, countries with gender parity indices greater than 1.02 (an indication of gender inequity disfavoring boys) were discounted to 1.00 with any amount over 1.02 then subtracted from 1.00.

7. The z-scores of the four indicators related to women’s health were averaged to create an index score of women’s health status. In Tier I, an index score of women’s economic status was similarly calculated as a weighted average of the ratio of female to male earned income (75 percent), length of maternity leave (12.5 percent) and percent of wages paid (12.5 percent). An index of child well-being – the *Children’s Index* – was also created by first averaging indicators of education, then averaging across all z-scores. At this stage, cases (countries) missing more than one indicator on either index were eliminated from the sample. Countries missing any one of the other indicators (that is educational, economic or political status) were also eliminated. The *Women’s Index* was then calculated as a weighted average of health status (30 percent), educational status (30 percent), economic status (30 percent) and political status (10 percent).

8. The *Mothers’ Index* was calculated as a weighted average of children’s well-being (30 percent), women’s health status (20 percent), women’s educational status (20 percent), women’s economic status (20), and women’s political status (10 percent). The scores on the *Mothers’ Index* were then ranked.

NOTE: Data exclusive to mothers are not available for many important indicators (school life expectancy and government positions held, for example). In these instances, data on women’s status have been used to approximate maternal status, since all mothers are women. In areas such as health, where a broader array of indicators is available, the index emphasizes indicators that address uniquely *maternal* issues.
